RCA SK Replacement Guide

RCA SK Replacement Solid State devices are "top of the line" quality units, purchased to OEM standards, from original solid state device manufacturers such as RCA's own Solid State Division. No RCA-SK is a "second" such as available from "barrel testers" and other "surplus" solid state device processors.

The RCA-SK Series relies upon the solid state "know-how" and resources of the RCA Corporation in its many electronic component and equipment activities to maintain continuity of line, to broaden its replacement capability and to select and approve all purchased SK's. Exact physical packaging and electrical characteristics that are "equal to or better than" the industry device being replaced is the continuing objective of the RCA SK Replacement Solid State Series and the RCA Corporation. A "defect ratio" of less than 1% is our result to date.

A Universal Stock Number System

Where an "SK" device replaces an ECG† device, the ECG number is now part of the SK number. For example SK3444 replaces the same industry devices as the ECG123A. Thus, if you need a "123A" replacement you can use an SK3444/123A with complete confidence.

The chart on pages 14 – 16 lists every ECG device for which an SK replacement exists. If you are accustomed to the ECG system, you can now use SK replacements as effectively and conveniently.

RCA Experimenter's Device

KD2131 Power Module

A complete 70-watt high-fidelity audio amplifier which features an essentially flat response over the entire audio-spectrum range and total harmonic distortion of less than 0.5% at an output of 60 watts. Measures approximately 3 in. (76 mm) long, 3.5 in. (90 mm) wide (including leads) and 0.5 in. (12.7 mm) thick. Complete circuit construction details for a stereo amplifier project including the power supply are included with each device.

For technical data, see Appendix, page 368.

Replacement Considerations

General

Before replacing an original-equipment device with the recommended RCA "SK" Type, the following basic factors should be considered:

(1) Compare the lead or terminal arrangement of the SK-replacement device with the lead or terminal arrangement of the original device. If these arrangements are different, and the original transistor is a plug-in type, bend the leads of the SK transistor so that the base, emitter and collector leads will mate with the corresponding socket terminals, and insulate the transistor leads if necessary, to prevent short-circuiting the device. Trim the transistor leads to the shortest length that will assure firm retention by the socket.

(2) Certain considerations are involved whenever an original-equipment transistor is replaced by one having a different type designation. When an RCA SK-Series transistor is used to replace an original-equipment device in an untuned amplifier stage operating at a low signal level such as an untuned RF-amplifier (antenna) stage of the radio receiver, or a low-level AF-amplifier stage, it is generally unnecessary to make any circuit adjustments to assure proper performance of the equipment. However, when a replacement is made in a tuned RF-amplifier stage, RF-oscillator, converter, or IF-amplifier stage, it is always advisable to check the alignment of the associated tuned circuits to assure proper tracking and to achieve the required gain without loss of stability.

(3) When replacements are made in stages operating at relatively high power levels such as Class A and Class B AF output stages of automobile radio receivers, phonographs, and AF-amplifier systems, the transistor bias should be checked and adjusted, if necessary, to protect the replacement transistors against excessive dissipation and to minimize distortion. Means for making such adjustments are generally provided in the equipment, and the necessary instructions are usually given in the equipment manufacturers' service data.

(4) When installing an SK-Series transistor as a replacement for an original-equipment type in an FM tuner, TV tuner, or other circuit operating at frequencies in the VHF or UHF regions, it is extermely important not to change any of the mechanical details of the original circuit. Before removing the original transistor, carefully note its position with respect to other circuit components as well as the lengths and placement of the transistor leads, and duplicate these details as precisely as possible with the SK-Series replacement transistor. Failure to observe this precaution can result in improper tuning or circuit instability, particularly in UHF TV tuners.

(5) When installing an SK-Series integrated circuit as a replacement for the original-equipment type in FM radios and TV receivers, it is extremely important not to change any of the mechanical details of the original circuit. Before removing the original integrated circuit carefully note its position with respect to other circuit components as well as the lengths and placements of the integrated circuit leads and duplicate these details as precisely as possible with the SK-Series replacement integrated circuit. Failure to observe this precaution can result in damage to the device.

Handling Considerations for MOS Integrated Circuits and Transistors

Because MOS devices have extremely high input resistance, they are susceptible to damage when exposed to extremely high static electrical charges. To avoid possible damage to the devices during handling, testing, or actual operation, therefore, the following procedures should be followed:

(1) The leads of devices should be in contact with a conductive material, except when being tested or in actual operation, to avoid build-up of static charge.

(2) Soldering-iron tips, metal parts of fixtures and tools, and handling facilities should be grounded.

(3) Devices should not be inserted into or removed from circuits with the power on because transient voltages may cause permanent damage.

(4) Signals should not be applied to the inputs while the device power supply is off.

(5) All unused input leads must be connected to either V_{SS} (grounded) or V_{DD} (device supply), whichever is appropriate for the logic circuit involved.

Matched Pairs of Transistors

When one transistor in a push-pull power-amplifier stage becomes inoperative, the resulting circuit imbalance may produce very large changes in the operating conditions for the stage. These changes will depend on the cause and nature of the failure, and may cause damage to associated circuit components, including the other transistor or transistors in the stage. Therefore, it is advisable to replace both or all transistors in a push-pull power-amplifier stage when one or more of the transistors become inoperative.

When both (or all) transistors in a push-pull power-amplifier stage require replacement, it is generally advisable to replace them with a matched pair or pairs such as the RCA-SK3013, SK3015, SK3028, SK3029, SK3037, or SK3086 even though the service data for the equipment does not specifically indicate that a matched pair or pairs should be used. In such cases, the use of a matched pair or pairs will simplify balancing adjustments and will help maintain the original performance quality of the equipment.

Silicon Rectifiers

Silicon rectifiers are inherently more efficient than selenium or other metallic-oxide type rectifiers. When a silicon rectifier is used to replace a selenium rectifier in the "B" supply of a typical line-operated radio or TV receiver, the silicon rectifier will frequently deliver from 25 to 50 volts higher DC output voltage than the original device.

In some cases, this higher "B" supply voltage may improve the performance of the equipment. In many other cases, however, it may immediately or eventually damage filter capacitors and/or other components which were designed to withstand only the voltage delivered by the original selenium rectifier. To prevent such damage, it is generally advisable to insert a power-type resistor (one having a rating of at least 10 watts) in series with the silicon rectifier either on the input side, between the AC supply and the rectifier, or on the output side between the rectifier and the first filter capacitor. The value of this resistor will depend on the required reduction in DC output voltage and on the DC load current of the equipment. This value may be determined experimentally or calculated from the equation:

$$R = E/I$$

where R is the required resistance in ohms, E the required reduction in DC output voltage in volts, and I the DC load current of the equipment in amperes.

The wattage rating of the resistor should be at least 2 times E times I and, in any case, should not be less than 10 Watts.

TV Silicon HV Triplers

Before replacing an original-equipment high-voltage silicon tripler with the recommended RCA SK type, compare the lead dress arrangement of the tripler being replaced and note carefully the connection lead positions with respect to other circuit components. These details should be duplicated as precisely as possible when installing the SK-Series replacement tripler.

Certain original-equipment triplers incorporate exposed, non-used focus terminals. When these units are replaced with SK-Series devices, it is extremely important to cover the unused terminal with silicone sealant. This is a precaution against arcing.

All soldering should be done with extra care, in accordance with the soldering precautions which follow. Keep all solder connections smooth so that no sharp solder points are visible. When solder connections are complete, cover all exposed solder joints and any exposed terminals with silicone sealant to prevent corona emission.

Two plastic tie-backs to assist in lead dressing, and a tube of silicone sealant, KH3429, are

packaged with each SK-Series replacement tripler for your convenience.

Soldering Precautions

Extreme care should always be used in making solder connections to semiconductors. Momentary application of excessive heat, or even prolonged application of a properly heated soldering tool to a semiconductor lead or terminal, can permanently damage the device. Always observe the following precautions in soldering to a semiconductor lead or terminal:

(1) Solder as far as possible from the body of the semiconductor.

(2) Never, under any circumstances, apply molten solder or a hot soldering tool to a lead or terminal for longer than 10 seconds or at a point closer than 1/16 inch to the body of the device.

(3) Use a small soldering tool, preferably one specifically intended for use with transistors or miniature circuit components.

(4) Keep the surfaces to be soldered clean and the tip of the soldering tool adequately tinned so that the connection can be made as quickly as possible.

(5) Always grip the lead or terminal to be soldered with a pair of long-nose pliers at a point between the intended solder connection and the case or body of the semiconductor. This precaution allows the pliers to act as a heat sink and to conduct heat away from the internal elements of the device.

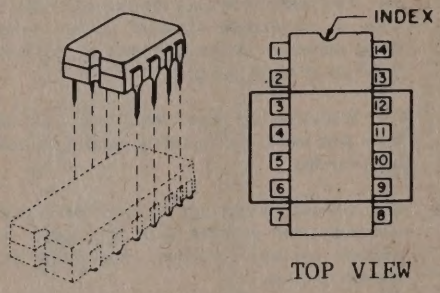
Case Dimensions

In some instances, the case of an SK-Series transistor may be slightly taller or thicker than that of the original transistor or have a slightly different shape, particularly if the original device is a foreign type not made to U.S.A EIA (JEDEC) Standards. These slight mechanical differences will not affect the performance of the equipment in which the replacement is made and normally will not prevent or complicate the installation of SK-Series transistor.

When a replacement must be made in extremely compact equipment, check the dimensions of the original device or the available mounting space, and compare them with the dimensions of the "SK" replacement types shown.

8-Pin IC Replacements for 14-Pin Types

In some instances, linear IC industry devices originally supplied in 14-lead DIL cases are currently provided by the manufacturer in 8-pin "Mini-DIP" (8-lead dual-in-line) cases. Because pins 1, 2, 7, 8, 13, and 14 were not connected in the original version, the new 8-lead package is a direct plug-in replacement for the 14-pin original. The 8-pin replacement should be installed in accordance with the diagram below.



Installation diagram for SK3552 and other 8-pin ICs replacing 14-pin types.

SK-Series semiconductors should not be inserted into or withdrawn from circuits with the power on because high transient current may cause permanent damage to the semiconductors. For SK-Series devices in metal cases, consideration should be given to the possibility of shock hazard if the metal shells of these semiconductors are to operate at a voltage appreciably above or below ground potential; in such cases, suitable precautionary measures should be taken.

For most effective protection, a power transistor should be operated with an adequate heat sink and with the lowest value of resistance or impedance in the emitter-to-base circuit consistent with driving-signal considerations. The transistor should be protected against extremely high collector-voltage pulses which may be generated when the device is operated with inductive loads particularly when current transients are present.

When replacing a power transistor, thyristor, or rectifier which is attached to the equipment chassis, or to a special heat sink, it is important to observe the following precautions:

(1) When removing the original device, make every effort to avoid damage to original mounting hardware, particularly insulating components such as mica or oxidized-metal washers, bushings, etc. Any such component which is damaged should be replaced with one of the original type. In the case of oxide-coated metal washers or wafers, which are frequently used as electrical insulators between the cases of power transistors and the chassis or heat sink, it is important not to scratch, chip, or otherwise damage the ox surface.

(2) When installing the SK-Series replacement device, make sure that all items of mounting hardware are replaced in their proper positions. If a mica or oxide-coated metal washer was used to insulate the case of the original device electrically from the chassis or heat sink, apply a thin coating of a zinc-oxide-filled silicone compound between the washer and the chassis or heat sink before installing the replacement device. RCA KH3429 or other silicone compounds for this purpose may be obtained from most electronics parts distributors.

Handling and Mounting Molded-Plastic Transistors and Thyristors

Power transistors and thyristors (SCR's and triacs) in TO-220 molded-silicone-plastic packages are designed for ease of use in a wide range of medium-power applications. The JEDEC package Type TO-220AB shown in Fig. 1, represents the basic style. This configuration features leads that can be formed to meet a variety of specific mounting requirements. Fig. 2 shows a JEDEC Type TO-220AA version of the package. The dimensions of this type of transistor package are such that it can replace the JEDEC TO-66 transistor package in a commercial socket or printed-circuit board without retooling.

Fig. 1 – JEDEC TO-220AB package

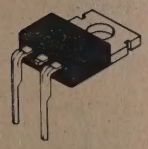


Fig. 2 – JEDEC TO-220AA package

The pin-connection arrangement of thyristors (SCRs and triacs) supplied in TO-220AA packages, however, differs from that of thyristors supplied in conventional TO-66 packages so that some hardware changes are required to effect a replacement.

TO-220 plastic packages are both rugged and versatile within the confines of commonly accepted standards for such devices. These packages lend themselves to numerous arrangements, and can be formed to a custom shape, provided that they are not indiscriminately twisted or bent. Although the leads can be formed, they are not flexible in the general sense; nor are they sufficiently rigid for unrestrained wire wrapping.

Before an attempt is made to form the leads of an in-line package to meet the requirements of a specific application, the desired lead configuration should be determined. When the use of a special-bending fixture is not practical, a pair of long-nosed pliers may be used. The pliers should hold the lead firmly between the bending point and the case, but should not touch the case. Fig. 3 illustrates the use of long-nosed pliers for lead bending. Fig. 3(a) shows techniques that should be avoided; Fig 3(b) shows the correct method. When the leads of an in-line plastic package are to be formed, whether by use of long-nosed pliers or a special bending fixture, the following precautions must be observed to avoid internal damage to the device:

1. Restrain the lead between the bending point and the plastic case to prevent relative movement between the lead and the case.
2. When the bend is made in the plane of the lead (spreading), bend only the narrow part of the lead.
3. When the bend is made in the plane perpendicular to that of the leads, make the bend at least 1/8 inch from the plastic case.
4. Do not use a lead-bend radius of less than 1/16 inch.
5. Avoid repeated bending of leads.

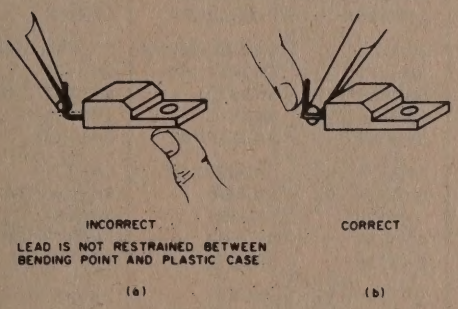

Fig. 3 – Use of pliers for lead forming

The leads of the TO-220AB package are not designed to withstand excessive axial pull. Force in this direction greater than 4 pounds may result in permanent damage to the device. If the mounting arrangement tends to impose axial stress on the leads, some method of strain relief should be devised.

Wire wrapping of the leads is permissible, provided that the lead is restrained between the plastic case and the point of the wrapping. When wires are used for connections, care should be exercised to assure that movement of the wire does not cause movement of the lead at the lead-to-plastic junctions.

Figs. 4 and 5 show recommended mounting arrangements and suggested hardware for the TO-220 transistors. The rectangular washer shown is designed to minimize distortion of the mounting flange when the transistor is fastened to a heat sink. Excessive distortion of the flange could cause damage to the transistor. The washer is particularly important when the size of the mounting hold exceeds 0.140 inch (6-32 clearance). Larger holes are needed to accommodate insulating bushings; however, the holes should not be larger than necessary to provide hardware clearance and, in any case, should not exceed a diameter of 0.250 inch. Flange distortion is also possible if excessive torque is used during mounting. A maximum torque of 8 inch-pounds is specified. Care should be exercised to assure that the tool used to drive the mounting screw never comes in contact with the plastic body during the driving operation. Such contact can result in damage to the plastic body and internal device connections.

OPERATING AND HANDLING CONSIDERATIONS

Handling

All inputs and outputs of RCA COS/MOS devices have a network for electrostatic protection during handling. Recommended handling practices for COS/MOS devices are described in ICAN-6525, "Guide to Better Handling and Operation of CMOS Integrated Circuits," available from RCA Solid State Division, Box 3200, Somerville, N.J. 08876.

Also, the handling precautions indicated under "Replacement Considerations" in the back of this catalog apply to both SK CMOS devices and RCA COS/MOS integrated circuits.

COS/MOS Operation

Operating Voltage

During operation near the maximum supply voltage limit, care should be taken to avoid or suppress power supply turn-on and turn-off transients, power supply ripple, or ground noise.

Input Signals

To prevent damage to the input protection circuit, input signals should never be greater than V_{DD} nor less than V_{SS}. Input currents must not exceed 10 mA even when the power supply is off.

Unused Inputs

A connection must be provided at every input terminal. All unused input terminals must be connected to either VDD or VSS, whichever is appropriate.

Output Short Circuits

Shorting of outputs to V_{DD} or V_{SS} may damage COS/MOS devices by exceeding the maximum device dissipation.

KD2131
Multi-Purpose 7-Ampere Operational Amplifier

The RCA KD2131 hybrid circuit linear operational amplifier is designed for operation from either single or split power supplies at output currents up to 7 amperes and power outputs up to 70 watts.

The KD2131 employs a quasi-complementary - symmetry output stage with hometaxial-base output transistors. It features low distortion, with a maximum total harmonic distortion of 0.5 per cent over a bandwidth of 30 kHz at a power output of 60 watts and a typical intermodulation distortion of less than 1 per cent at rms power outputs from 0.2 to 70 watts. Additionally, the device incorporates adjustable idling current and direct coupling to the load.

The KD2131 is supplied in a hermetic metal package (see Terminal Assignment below). The device measures approximately 3 inches by 3.5 inches (76 x 90 mm) including leads, and is approximately one-half inch (12.7 mm) thick.

Complete circuit construction details for a stereo amplifier project, including the power supply, are included with each device. Small industrial users may find the KD2131 useful for servoamplifiers, audio power amplifiers, driven inverters, power operational amplifiers, deflection amplifiers, solenoid drivers, voltage regulators, and similar linear-amplifier power applications.

Features:

- Bandwidth: 30 kHz at 60 W
- High power output
- High output current: 7A (peak)
- Low IMD and THD
- Adjustable idling current
- Stability with resistive or reactive loads
- Single or split power supply (30 to 75 V, single, ± 15 to ±37.5, split)
- Class B output
- Direct coupling to load (split supply)
- Built-in load-line-limiting circuit to protect amplifiers from accidentally short-circuited output terminals
- Reactive-load fault protection
- Rugged package with heavy leads
- Light weight: 100 grams

"I prefer RCA SK's because they have the abilities:

STANLEY J. LYSY

Ready Availability
Wide Interchangeability
Excellent Identifiability
and High Reliability.

All these add up to Good Profitability."

These are the words of Stanley J. Lysy of Service Plus, Westfield, Massachusetts.

An Electronic Service Technician speaks out for RCA SK's

To paraphrase Mr. Lysy, one of the ten winners in RCA's recent SK slogan contest, RCA SK's are indeed readily available. As for interchangeability, over 1,045 SK types replace over 161,000 domestic and foreign types. Our new SK numbering system which incorporates the other leading numbering system used by ECG* REN and TM makes it easier than ever for you to identify the right SK replacement. And of course, SK reliability means fewer costly call-backs for you.

As Mr. Lysy points out, all these "Abilities" add up to the most important "Ability" of all . . . Profitability.

See your RCA SK distributor for all your solid state replacement needs and ask for your copy of the new authoritative RCA SK Replacement Guide, SPG202Y, or send your request with check or money order for $1.50 to RCA Distributor and Special Products, P.O. Box 597, Woodbury, N.J. 08096.
